

## **KIDS COUNT in Missouri**

Welcome to the *KIDS COUNT in Missouri 2013 Data Book.* The *Data Book* is a collaborative project of the Children's Trust Fund and the Office of Social and Economic Data Analysis at the University of Missouri, and more than 20 public and private organizations across the state.

The mission of the *KIDS COUNT in Missouri Data Book* is to improve the well-being of Missouri's children and families. The *KIDS COUNT in Missouri Data Book* and website, http://oseda.missouri.edu/kidscount/, are easily accessible tools to assist local and state public policymakers and child advocates in identifying both needs and solutions. *KIDS COUNT in Missouri* data are used to brief legislators, inform policy, and are integral to informing child advocates.

The annual *KIDS COUNT in Missouri Data Book* documents the status of children in Missouri's 114 counties and the City of St. Louis. First produced in 1993, the *KIDS COUNT in Missouri Data Book* remains an invaluable repository of comprehensive, longitudinal information on the status of children.

#### PARTNERS

Thanks to the Annie E. Casey Foundation for their continued support of the *KIDS COUNT in Missouri* initiative. Primary funding for the *KIDS COUNT in Missouri 2013 Data Book* comes from the Children's Trust Fund.

The Children's Trust Fund (CTF) is a nonprofit organization dedicated to the prevention of child abuse and neglect through grant distribution, education/awareness, and partnerships. CTF was created by the Missouri General Assembly in 1983 and is governed by a 21-member Board of Directors appointed by the Governor and confirmed by the Missouri Senate. For more information, visit www.ctf4kids.org.

Established in 1980, the University of Missouri Office of Social and Economic Data Analysis (OSEDA) conducts public policy support research for communities, agencies and other partners in Missouri. OSEDA strives to transform data into useful information. We believe the construction of meaningful information is an inherently collaborative enterprise.

The Annie E. Casey Foundation is the nation's largest philanthropic source for disadvantaged children. The Casey Foundation supports a network of state-level KIDS COUNT projects that shapes a new direction for American's children.

The *KIDS COUNT in Missouri 2013 Data Book* was produced by Children's Trust Fund and the University of Missouri Office of Social and Economic Data Analysis. Permission to copy, disseminate, or otherwise use information from this report is granted as long as appropriate acknowledgement is given. This report, the full data set, and corresponding interactive data tools are available at www.oseda.missouri.edu/kidscount.

# **Executive Summary**

The *KIDS COUNT in Missouri 2013 Data Book* provides information on measures of child well-being for the state, its 114 counties, and St. Louis City. By showing data trends across time and geographic areas, this book gives local and state policymakers, as well as other child advocates, the crucial information they need to make informed decisions regarding how best to support the well-being of children across the state.

To track changes over time, *KIDS COUNT in Missouri* provides the most currently available data (2012) as well as data from 2008 (the base year). (Please note that the exact years for which data are provided differ slightly between indicators and outcomes based on the nature of the data.) Between the base and current years, three *KIDS COUNT in Missouri* outcome measures worsened and seven improved.

Measures that improved were

- · births to mothers without a high school diploma,
- · low birthweight infants,
- infant mortality, child deaths,
- teen violent deaths,
- percent of annual high school dropouts, and
- births to teens.

The three measures that worsened were

- the number of students enrolled in free/reduced lunch,
- child abuse/neglect and family assessments, and
- out-of-home placements.

(The Missouri State Profile on p. 4 contains more specific information on these outcomes.)

It is essential to keep in mind the larger national context and how it has potentially affected the outcomes tracked in *KIDS COUNT in Missouri*. Starting in 2008, Missouri, like the rest of the United States, experienced an economic downturn on a scale unprecedented since the Great Depression of the 1930s. Although the national and state economies are recovering, the "Great Recession" resulted in greater numbers of children and families facing deep economic insecurity, especially higher unemployment, as evidenced by increases in measures of poverty. Although the long-term effects of the "Great Recession" are not completely clear, we do know that more families and children are in poverty than before it occurred—and that poverty has been shown to have significant negative impact on children's development, including potential for success in school and later in life.

Because the *KIDS COUNT* project, both in Missouri and nationwide, strives to provide both the most current and most local data available to describe the status of children, some indicators are based on administrative data collected through state agencies in delivery of existing services and programs. In the past several years, state programs providing services to Missouri citizens have changed over time, often decreasing, based on declining state revenue. It is incumbent upon users of the *KIDS COUNT in Missouri Data Book* to distinguish between changes in rates or numbers of this year's *KIDS COUNT* data that indicate an authentic improvement in the quality of children's lives versus changes that reflect scaled-back services and resources.

#### **ECONOMIC WELL-BEING**

**Students enrolled in free/reduced lunch**, a proxy measure of child poverty, increased notably throughout the last decade. In 2002, 38% of Missouri's students lived in families whose incomes were low enough to qualify for this program, and by 2012 the proportion of children rose to nearly half (49%). This increase is likely due to a combination of more children living in poverty and increased efficiency due to streamlined enrollment based on eligibility for other low-income programs. Children living in or close to poverty are at higher risk than other children for health, educational, and social problems.

In 2012, 15% of Missouri births were to **mothers without a high school diploma**. During the decade between 2002 and 2012, this rate trended downward from nearly 19% in the early years of the decade to the current rate. Children who are born to undereducated parents face the highest odds of living in chronic poverty.

Consistent with administrative record indicators such as the SNAP (food stamps) and free/reduced lunch, the U.S. Census Bureau's American

Community Survey estimates that the percent of Missouri children under 18 living in poverty increased from 15% in 2000 to 22% in 2011, more than 1 in 5 children statewide. More than 1 in 4 (26.3%) Missouri children under 6 were living in poverty in 2011. Although adult unemployment in Missouri peaked in 2010 at 9.3%, the 2012 figure of 6.9% is higher than the 2008 rate of 6.1%.

#### **MEASURES OF HEALTH**

The percent of **low birthweight infants** has decreased from the 2003-2007 rate of 8.1% to the current period's 2008-2012 rate of 8.0%. However, the rate was lower nearly 20 years ago; the 1993-1997 rate was 7.6%.

In contrast, the **infant mortality rate** has declined since 1993-1997, when the rate was 7.8 infants per 1,000 births, to the current 2008-2012 rate of 6.8. This is due to a combination of improved medical technology and public health outreach efforts. Despite these improvements, during the years 2008 through 2012, over 2,600 Missouri babies died before their first birthday.

The number of **children enrolled in Medicaid** increased between 2008 and 2012 from 33.3% to 37.4%, which reflects the more turbulent economic conditions facing Missouri families today.

#### **MEASURES OF CHILD PROTECTION AND SAFETY**

The **child death rate** has improved steadily over the past decade. The rate for 2008-2012 was 17.9 deaths per 100,000 children ages 1-14, a 16% decrease from the 2003-2007 figure of 21.2. Despite these positive gains, on average, over 200 children between the ages of 1 and 14 died in Missouri every year between 2007 and 2011. **Violent deaths of teens** decreased between the periods 2003-2007 and 2008-2012 from 64.5 to 58.5 per 100,000 teens ages 15-19. Motor vehicle accidents were responsible for 30% of deaths in this age group for the 2008-2012 period.

The **child abuse/neglect and family assessments** indicator measures the number of child abuse victims documented in reports that cited a "preponderance of evidence" that child abuse or neglect occurred, as well as the number of family assessments conducted by the Missouri Department of Social Services. The indicator is expressed as a rate per 1,000 children. The rate has increased over time, from 31.9 in 2008 to 35.9 in 2012. **Out-of-home placement entries** are used to measure the status of children who are confirmed victims of abuse/neglect, and who are living in environments posing immediate risk or environments not responding immediately to intervention to prevent further physical or emotional threat or injury to children. This indicator is expressed as a rate per 1,000 children. Similar to the rate of child abuse/neglect and family assessments, out-of-home placement entries increased from 3.8 in 2008 to 4.6 in 2012.

#### **MEASURES OF EDUCATION**

The two outcomes for education have shown improvements over time. The 2012 **high school dropout rate** of 3.0% was the lowest in a decade, and a decrease from the 2008 rate of 3.5%. Although this percentage may seem low, nearly 8,000 students dropped out of public high schools in the 2011-2012 school year, increasing their risks of economic insecurity and other negative outcomes.

Missouri's **teen birth rate** declined 26% between 2008 and 2012, to 32.2 births per 1,000 teens—the lowest rate since 2000. In 2000, about 9,800 Missouri teens, ages 15-19, gave birth. In 2012, approximately 6,300 teens gave birth. Although the number of teens giving birth annually has fallen, thousands of teen mothers and their children remain at risk for poverty, unemployment/underemployment, and health problems.

#### **COMPOSITE COUNTY RANK**

A composite county rank is calculated for each county based on six outcome measures: students enrolled in free/reduced lunch, births to mothers without a high school diploma, infant mortality, out-of-home placement entries, annual high school dropouts, and births to teens. Counties are assigned a rank between 1 (best) and 115 (worst) to describe the relative well-being of children compared to other Missouri counties. The ranks assist those interested in enhancing well-being by providing information on which counties have the greatest and least needs. As shown on pp. 7-8, more populous suburban counties of metropolitan areas and micropolitan counties tend to have better rankings than rural counties. In general, two regions stand out as falling behind the state overall: the north-central and southern parts of Missouri, especially the southeast.

# **Understanding the Data**

#### UNDERSTANDING THE 2013 STATE AND COUNTY PROFILE PAGES

*KIDS COUNT in Missouri* provides a comprehensive view of the status of children in Missouri through outcome measures and contextual indicators that are compared across time. The outcomes (A) are organized by four domains: economic well-being, health, child protection and safety, and education. The indicators (B) are organized by four domains: economic well-being, health, education, and demographic.

The *KIDS COUNT in Missouri 2013 Data Book* state and county pages include six outcome measures reported by base year, 2008, and current year, 2012. For four measures (low birthweight infants, infant mortality, child deaths, and violent teen deaths), five-year periods of data are aggregated to provide more stable rates. In addition, data from 17 supplementary indicators are provided to give additional context for the outcome measures. As with the outcome measures, base year and current year data at five-year increments are provided for the indicators.

On the county pages, both counts (number) and rates are given for the outcome measures. The count represents the number of cases (e.g., children, incidents, events) that meet the outcome measure definition over a given number of years (one or five years, depending on the measure). A count is presented for both the base and current years. The rate represents the ratio of cases measured by the indicator to the total possible population of cases that could be affected over the one- or five-year period. The ratio is expressed as either a percent or a rate per a specific increment of the population, such as "per 1,000" or "per 100,000." The state rate **[]** is also provided for each outcome measure.

A symbol is provided for each outcome measure to describe the direction of the trend  $\bigcirc$  between the base year and current year. An upward arrow  $\blacklozenge$  indicates outcomes for children are improving, while a downward arrow  $\blacklozenge$  indicates a decline in the well-being of children. The sideways arrow  $\blacklozenge$  means the figure was unchanged. Detailed definitions of the *KIDS COUNT in Missouri* outcome measures are provided in the "Data Notes & Sources" section.

#### **UNDERSTANDING THE 2013 COMPOSITE COUNTY RANK**

74 Kids Count in Missouri 2013 Data Book County Profile

Counties are assigned a rank between 1 (best) and 115 to describe the relative well-being of their children compared to Missouri as well as other counties and St. Louis City. A composite county rank is calculated for each county based on six of ten outcome measures. Four measures (low birth weight infants, child deaths, child abuse and neglect, and violent deaths) are not used to calculate this rate due to potential instability in the data.

#### **USING COUNTY DATA**

The *KIDS COUNT in Missouri 2013 Data Book* is available online on the Office of Social and Economic Data Analysis website: <u>www.oseda.missouri.edu/</u><u>kidscount</u>. The data from past *KIDS COUNT* data books are also available on the website.

The Annie E. Casey Foundation's KIDS COUNT Data Center (<u>http://datacenter.kidscount.org/</u>) also provides easy online access to *KIDS COUNT in Missouri* data, as well as child well-being data for all U.S. states and many cities, counties, and school districts. Data indicators can be found for such topics as education, employment and income, health, poverty, and youth risk factors.

# **Missouri Minority Profile**

According to American Community Survey 2012 data, there are more than 1.4 million children under 18 living in Missouri. Almost one in four (24%) of these children are of a racial minority, including African American, Asian, Native American, and children of one or more races. Although still a relatively small part of the overall child population, Hispanic children now make up 6%, a proportion almost double what it was in 2000.

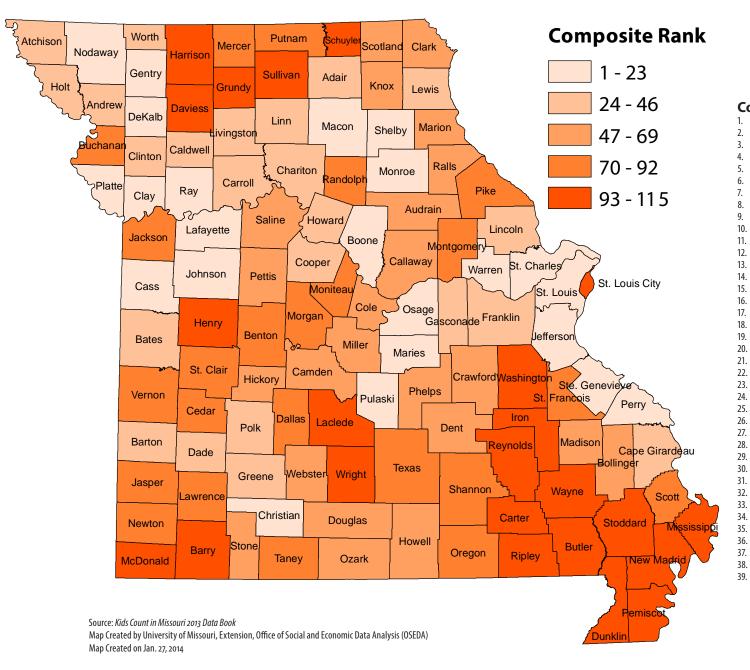

The table above shows outcomes by minority status for the base and current years. Minority refers to individuals who are African American, Asian, American Indian or Alaska Native, Native Hawaiian/Pacific Islander, a combination of races, and/or who identify as Hispanic; Nonminority refers to non-Hispanic White individuals. In general, both groups have experienced more positive trends than negative ones. For both minority and nonminority Despite the mostly positive trends for both groups, minority teens are far more likely to give birth and to have low birthweight infants compared to their nonminority peers. Nonminority mothers are more likely to have at least a high school diploma, compared to minority mothers. Minority teens have a higher high school dropout rate and violent teen death rate compared to nonminority teens. On the other hand, minority children have lower rates of out-of-home placement and child abuse/neglect and family assessments in comparison with nonminority children.

children in Missouri, seven outcomes improved and two worsened. For both groups, the rate of out-of-home placements increased. For minority children, the violent teen death rate increased. For nonminority children, the rate of child abuse/neglect cases and family assessments increased. For the other seven tracked outcomes, the trend is positive for both minority and nonminority children in Missouri.

Outcome Measures	Minority				Nonminority	
Outcome measures	Base Year	Current Year	Trend	<b>Base Year</b>	<b>Current Year</b>	Trend
Births to mothers without HS diploma 2008/2012	22.6%	21.2%	<b>↑</b>	16.7%	13.5%	<b>↑</b>

# **Composite County Rank by Population Category**

These population categories are based on the federal government's Office of Management and Budget (OMB) and are used by the Census Bureau. A metropolitan area contains a core urban area of at least 50,000 in population, whereas a micropolitan area has an urban area of 10,000-49,999. Both metropolitan and micropolitan areas consist of the county that contains the core urban area, as well as any adjacent counties that have a high degree of economic and social integration with the core urban area, as measured by commuting-to-work patterns. In some cases, relatively smaller counties are classified as part of a metropolitan area, even though their own population is not especially large.

# **Interpreting the Data**

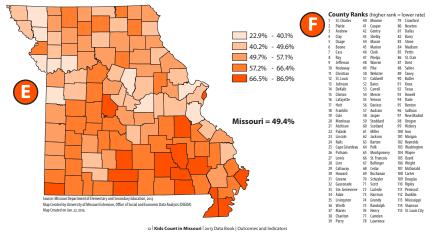

#### UNDERSTANDING THE 2013 INDICATOR AND OUTCOME PAGES

The sample below shows how each data element section is organized. At the top of the first page for each data element, you will find a label showing the domain A and whether the data element is an outcome or indicator B. The name of the data element G is followed by brief text explaining the importance of the outcome and how it should be interpreted D. The first page shows a map of the Missouri counties and their performance on the outcome or indicator E, as well as a list of county ranks F. Instructions on how to interpret the county ranks are provided. The best rank is "1," whereas the worst rank is "115." Higher ranks are considered better ranks, even though they are smaller numbers! When applicable, county ranks are shown such that improvement on an outcome or indicator will result in better rankings.

#### ECONOMIC WELL-BEING: OUTCOME B C Students Enrolled in Free/Reduced Lunch

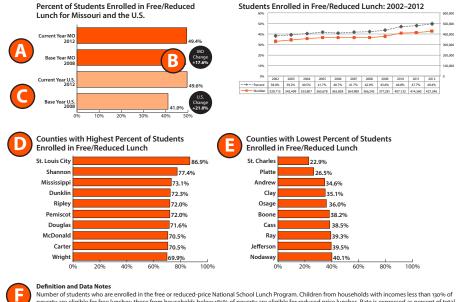

Participation in the free/reduced-price lunch program is a widely used proxy for measuring the extent of child poverty. Economic hardship can have profound negative effects on children's health and development. Children from families with low incomes have a greater risk for delays in cognitive development and learning problems.<sup>1,2</sup>

#### Percent of Students Enrolled in Free/Reduced Lunch by County: 2012

On the second page, you will find a variety of graphs about the specific data element. The status of Missouri for the current and base years is shown (A), with the percent change between the years highlighted (B). This percent change indicates the extent to which the outcome/indicator increased (plus sign, +) or decreased (negative sign, -) between the base and current years. For indicators and outcomes that are percentages, it should be noted that the percent change is not simply the difference between the two percentage figures but represents the extent to which the figure changed relative to the base percent. When applicable, comparable data for the U.S. are shown, including percent change over time (C). A graph showing number and percent/rates over time for Missouri is provided to show trends in the data over time. The final two graphs show which counties had the highest (D) and lowest values (E) on the particular data element.

Definition and Data Notes **F** provide explicit information about the source of the outcome or indicator and how it is calculated. If applicable, the final part of the section will contain footnotes from the introductory text **G**.

#### **DOMAIN ORGANIZATION**

The following pages provide more specific data for Kids Count in Missouri outcomes and indicators, which are organized into the domains shown below.

	DOMAINS							
	Economic Well-Being	Health	Child Protection & Safety	Education	Demographic			
6	Students enrolled in free/reduced lunch	Low birthweight infants*	Child deaths, ages 1-14 (per 100,000)*	Annual high school dropouts				
OUTCOMES	Births to mothers without high school diploma	Infant mortality (per 1,000 live births)	Child abuse/neglect cases and family assessments (per 1,000)*	Births to teens, ages 15-19 (per 1,000)				
ουτο			Out-of-home placements (per 1,000)					
			Violent teen deaths, ages 15-19 (per 100,000)*					
	Children under 18 in poverty	Children enrolled in MO HealthNet for Kids		English language learners	Child population			
	Children under 6 in poverty	Children receiving public mental health services		Licensed child care capacity(per 1,000)	Children as % of total population			
S	Children in single-parent families			Accredited child care facilities	Minority children			
INDICATORS	Children receiving child care assistance (per 1,000 in poverty)			Juvenile law violation referrals, ages 10—17 (per 1,000)				
NDIC	Children receiving cash assistance							
5	Children receiving SNAP (food stamps)							
	Average annual wage/salary							
	Adult unemployment							

\*Not included in County Composite Rank

# **ECONOMIC WELL-BEING: PERSPECTIVE**

A family's economic well-being has a great impact on a child's ability to develop into a healthy, productive adult. KIDS COUNT in Missouri tracks many indicators related to economic conditions for Missouri's children and families, including parental education and employment, enrollment in federal assistance programs, and child poverty, in order to provide a full picture of how our children are faring. Because no single outcome or indicator represents how well children and families are faring economically, all of the indicators included in this section should be examined closely.

KIDS COUNT in Missouri tracks two economic well-being outcomes:

- Students enrolled in free/reduced lunch
- Births to mothers without high school diplomas

In addition, seven other economic well-being indicators are reported:

- Children under 18 in poverty
- Children under 6 in poverty
- Children in single-parent families
- Children receiving child care assistance
- Children receiving cash assistance
- Children receiving SNAP (food stamps)
- Average annual wage/salary
- Adult unemployment

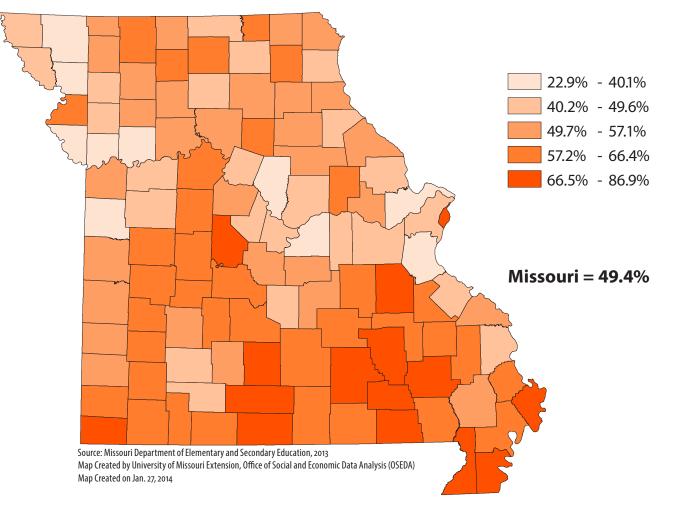

For the most part, the economic outlook for the children and families in Missouri has been declining. Since 2008, the percentage of students enrolled in the free/reduced-price lunch program increased by 18%; in 2012; nearly half of Missouri's children qualified for the program. The percentage of children receiving SNAP (Supplemental Nutrition Assistance Program, formerly known as food stamps) increased over 20% over the same time period. Since 2000, the percentage of children in poverty increased 39%, the percentage of children under 6 in poverty has burgeoned by 43%, and the percentage of children in single-parent families has gone up over 37%. However, not all trends related to economic security are in decline. Since 2008 progress has been made on the percentage of births to mothers without a high school diploma (a decrease of 15%).

### **ECONOMIC WELL-BEING: OUTCOME**

# **Births to Mothers without High School Diplomas**

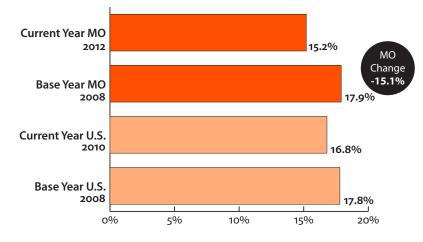

Children born to mothers with fewer than 12 years of education face increased odds of living in chronic and/or severe poverty. Parents with low education levels typically have lower incomes than those with more education.<sup>1</sup> Higher levels of parental education are strongly associated with positive outcomes for children, including better school readiness and academic achievement, lower rates of smoking and drinking, and higher rates of volunteering.<sup>2</sup>

## ECONOMIC WELL-BEING: INDICATOR Children Under 18 in Poverty

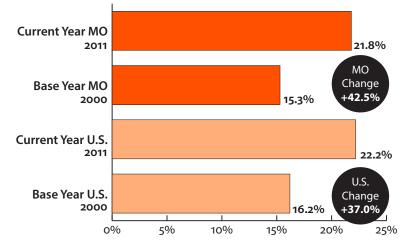

Poverty has a significant negative effect on child development. It interferes with children's cognitive development as well as ability to succeed in school.<sup>1</sup> In addition, children exposed to poverty are at a higher risk for mental disorders and antisocial behaviors.<sup>1</sup> A recent brain imaging study showed that poverty affects the physical structure of children's brains; children in poverty had smaller volumes of white matter and cortical gray matter, as well as smaller hippocampuses and amygdalas, which are critical to stress regulation and emotion processing.<sup>2</sup>

## Percent of Children Under 18 in Poverty for Missouri and the U.S.

#### Counties with Highest Percent of Children Under 18 in Poverty

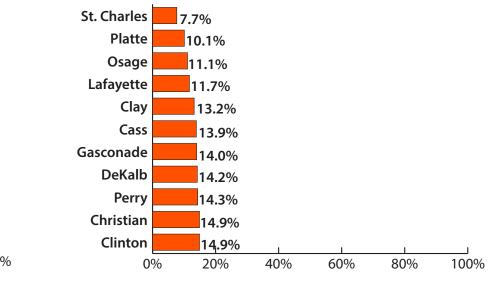

#### Children Under 18 in Poverty: 1990–2011

Note: The last two data points are only one year apart.

Counties with Lowest Percent of Children Under 18 in Poverty

#### **Definition and Data Notes**

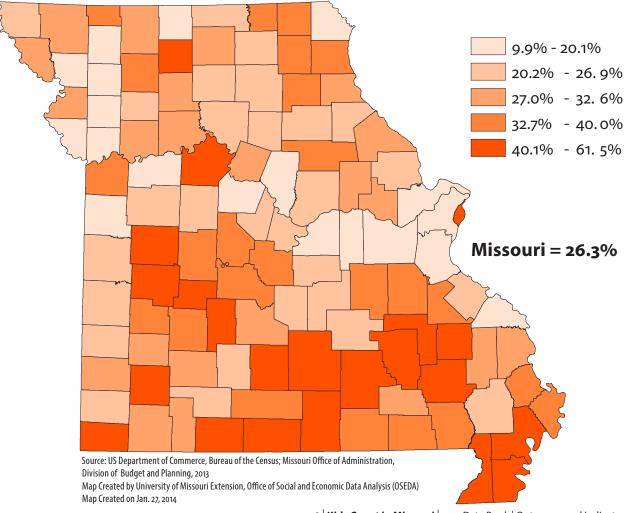

Percentage of related children under age 18 who live in families with incomes below the U.S. poverty threshold, as defined by the Bureau of the Census. The federal poverty threshold depends on the number of adults and children in a family. In 2011, the current year used for this indicator in this data book, the federal poverty threshold for a family of two adults and two children was \$22,811. For 2013, the federal poverty threshold for the same family was \$23,624. For counties with a population of less than 20,000, an estimate based on county-PUMA (Public Use Microdata Area) ratio is reported. *Source: U.S. Department of Commerce, Bureau of the Census*.

## ECONOMIC WELL-BEING: INDICATOR Children Under 6 in Poverty

Very young children are more likely to live in poverty than older children. Thus, the percentage of children under 6 in poverty is higher than that of all children in poverty. Many factors contribute to an increased likelihood of children experiencing poverty at a young age, including the relative youth of parents (which limits earning potential), as well as the need for child care (parents either pay for it or stay at home to take care of young children). Poverty interferes with children's development at all ages, but its developmental effects are more pervasive and persistent for children who experience economic hardship when very young.<sup>1</sup>

### **ECONOMIC WELL-BEING: INDICATOR**

# **Children in Single-Parent Families**

In 2011, more than one-third of Missouri's children lived in single-parent families. The relationship between poverty and family structure is shown by the fact that more children living in single-parent families nationally were in poverty (37%) compared to children living in married-couple families (9%).<sup>1</sup>

Two-parent families tend to have higher household incomes and more assets than single-parent families; as a result, single parents may find it more challenging to maintain a high quality of home and out-of-home experiences for their children.<sup>2</sup> In addition, economic hardship may increase single parents' psychological distress and decrease sensitive caregiving.<sup>3</sup> These factors can lead to negative effects on children's cognitive and social development and impact their long-term academic achievement.<sup>4</sup>

## ECONOMIC WELL-BEING: INDICATOR Children Receiving Child Care Assistance

State child care assistance is essential in providing reliable child care for children of low-income parents who would otherwise not be able to afford such care and who wish to participate in the workforce. Higher rates on this indicator suggest better support for poor families with respect to child care access. For center-based care in 2012, the average cost of full-time child care for an infant in Missouri was \$8,580; for a four-year-old in full-time center-based care, the average cost was \$5,928. For home-based care, the average cost of full-time child care for an infant in Missouri was \$5,564; for a four-year-old, the average cost was \$4,836.<sup>1</sup> These figures are nearly equal to tuition at state universities. The prohibitive cost of child care often forces families to make difficult decisions such as leaving a job to take care of children or enrolling their child in low-quality care that is not regulated by the state.

In 2012, eligibility for child care assistance was at 123% of the federal poverty threshold, one of the lowest levels in the nation. In fact, Missouri ranks 48th in terms of supporting poor families with child care.<sup>2</sup>

## ECONOMIC WELL-BEING: INDICATOR Adult Unemployment

Unemployment rates provide another picture of the general economic conditions of a state, region, or county. As more adults have problems finding employment, the number of children and families in poverty increases. Higher unemployment rates are also associated with families using more government services, such as Temporary Assistance to Needy Families (TANF) and Supplemental Nutrition Assistance Program (SNAP, formerly known as the Food Stamps Program) to help make ends meet.

32 | Kids Count in Missouri | 2013 Data Book | Outcomes and Indicators

# **HEALTH: PERSPECTIVE**

A healthy start in life provides children with the necessary foundation for healthy development and the capacity to learn. Indicators of a healthy start include quality prenatal care, consistent access to healthcare services throughout childhood and adolescence, proper immunization, and good nutrition.

The majority of Missouri children access health coverage through private insurance and/or MO HealthNet for Kids, which is Missouri's public health insurance program for lowincome children who do not have access to other health coverage. A portion of Missouri's children remain without healthcare coverage, including many who are eligible for coverage.

*KIDS COUNT* tracks two outcomes directly related to children's health and mental health:

- Low birthweight infants
- Infant mortality

In addition, two other health and mental health indicators are reported:

- Children enrolled in MO HealthNet for Kids
- Children receiving public mental health services

In comparison to the baseline years, the status of Missouri children's health and mental health with respect to these outcomes and indicators is mixed. Infant mortality, which has been declining for some time, decreased 9% between the period 2003-2007 and the period 2008-2012. Concurrently, the rate of low birthweight infants decreased slightly (1%) between these time periods. Changes in the other two indicators are more difficult to interpret. Because they reflect services provided by state government, their ability to act as good proxies for children's health status may be affected by a number of factors, including budget shortfalls, changes in funding priorities, or administrative changes in how data are tracked. With this in mind, between 2008 and 2012, the percentage of children enrolled in MO HealthNet for Kids increased 12% and the number of children who received public mental health services increased 34%.

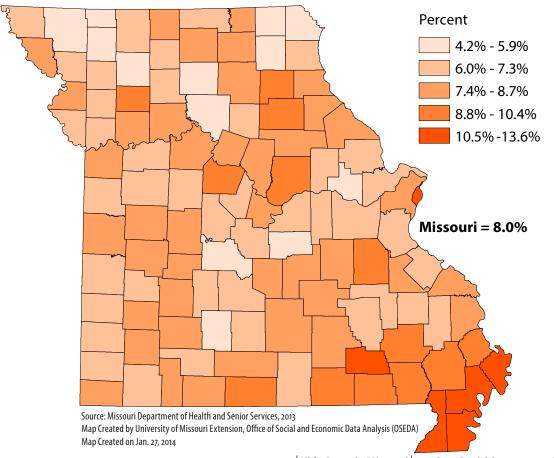

## **HEALTH: OUTCOME**

# **Low Birthweight Infants**

Infants born with low birthweights are at high risk for adverse outcomes and developmental problems throughout their lives. In general, the smaller the baby at birth, the higher his or her risk for complications.<sup>1</sup>

There are two main reasons why a baby may be born with a low birthweight: premature birth and fetal growth restriction. Growthrestricted babies may be born full-term, but are underweight because they did not grow well during pregnancy due to problems in the uterus, the mother's health, or birth defects. Premature birth occurs when a baby is born before 37 completed weeks of pregnancy. About 67% of low birthweight babies are premature.<sup>1</sup>

Babies born with a low birthweight may have increased risk for certain chronic conditions in adulthood, including high blood pressure, adult-onset diabetes, and heart disease.<sup>1</sup>

## **HEALTH: OUTCOME**

# **Infant Mortality**

Infant mortality has long been an indicator of the health of a community, state, and nation because of its association with such factors as maternal health, quality and access to medical care, socioeconomic conditions, and public health practices. Infants are more likely to die before their first birthday if they live in unsafe homes and neighborhoods or have inadequate nutrition, health care, or supervision. The leading causes of infant death are congenital malformations (physical defects present at birth), disorders related to short gestation or low birthweight, and sudden infant death syndrome (SIDS).<sup>1</sup>

The Missouri infant mortality rate was 6.2 in 2012. However, this rate differs greatly between whites and blacks. In 2012, the rate for black infants was 12.3, compared to the 5.6 rate for white infants.<sup>2</sup>

## **HEALTH: INDICATOR**

# **Children Enrolled in MO HealthNet for Kids**

MO HealthNet for Kids is the Medicaid program for children and also the State Children's Health Insurance Program (SCHIP) in Missouri for families with higher incomes. Administered by the Department of Social Services, MO HealthNet for Kids provides a full range of medical services such as preventive care, primary care, as well as hospital and pharmacy services. To qualify for benefits, a child must be a resident of Missouri under 19 years old, have a social security number, and be a U.S. citizen or legal resident. Eligible applicants must also meet certain income guidelines according to their family size.

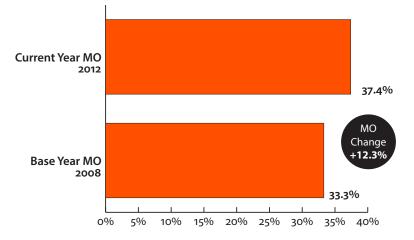

Income guidelines for MO HealthNet for Kids (non-SCHIP) are between 100 and 185 percent of the Federal Poverty Level. For SCHIP, the guidelines range between 150 and 300 percent of the poverty level. If families meet income criteria, and their child has been uninsured for at least six consecutive months, they may be able to qualify. In addition, the family's assets must also have a net worth under \$250,000. Those who have an income over 150 percent of the poverty level are required to may a premium each month for their coverage.

## **HEALTH: INDICATOR**

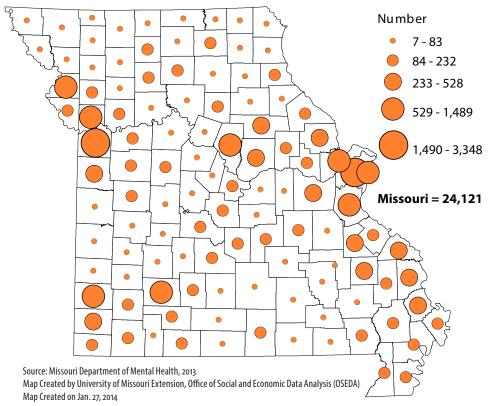

# **Children Receiving Public Mental Health Services**

Children and adolescents are susceptible to many of the same mental illnesses that afflict adults. Half of all lifetime cases of mental illness begin by age 14.<sup>1</sup> Helping children and their parents manage difficulties early in life may prevent the development of many disorders. Once mental illness develops, it becomes a regular part of a child's behavior and more difficult to treat.

Even though we know how to treat—though not yet cure—many disorders, many children with mental illnesses are not getting treatment. Without treatment, these children will be at risk for falling behind in other domains of development, thereby decreasing the likelihood that they will become happy, stable, productive adults.

Young people are especially at risk of depression, obsessive-compulsive behaviors, phobias, and substance abuse.<sup>2</sup> As many as one in five Missouri children may have a behavior disorder, ranging from barely noticeable to disruptive to their education, development, and family life.<sup>2</sup>

The causes of mental disorders are varied, but most are caused by imbalances in the brain's chemistry, by injury to the head and brain, or by emotional trauma. Some mental illnesses are more prevalent in some families, suggesting a genetic link.<sup>3</sup> County Ranks

### **Counties with Lowest Number of Children Receiving Public Mental Health Services for Missouri**

27 counties had zero.

#### **Definition and Data Notes**

The number of children receiving mental health services for serious emotional disorders (SED) through the Missouri Department of Mental Health. The Missouri Department of Mental Health defines SED as any emotional, behavioral, or mental disorder that requires multiple services; severely disrupts daily functioning in the home, school, or community; and has either been present for one year, or is expected to last a year or more.

Due to recent administrative changes in how these services are tracked within the divisions of mental health, it is difficult to compare numbers across years.

# CHILD PROTECTION AND SAFETY: PERSPECTIVE

Child safety is another aspect of child well-being. Injuries, both intentional and unintentional, are the leading cause of death for children between the ages of 5 and 14.1 Most injuries and injury-related deaths can be prevented through proven interventions that include education, environmental or product modification (car seats, bicycle helmets, smoke detectors), and better enforcement of legislation or regulations related to child safety.<sup>2</sup> Intentional injuries occur when there is intent to harm. They include injuries that occur as a result of violence, abuse, or neglect. Strategies for preventing these types of injuries are different from the strategies employed to prevent unintentional injuries, and they are not as well understood.<sup>2</sup>

Childhood maltreatment can adversely affect development, health, and well-being in the short and long term. Abused and neglected children are at higher risk of mental health disorders and more likely to engage in risk-taking behavior throughout childhood, adolescence, and adulthood.<sup>3</sup>

KIDS COUNT tracks four outcomes directly related to children's protection and safety:

- Child death, ages 1-14
- Child abuse and neglect
- Out-of-home placement entries
- Violent teen deaths, ages 15-19

In some important ways, the status of Missouri's children with respect to child protection and safety has improved. The rates for child death and teen violent death have both decreased from the 2008-2012 period compared to the 2003-2007 period. On the other hand, the rates for two other crucial outcomes have increased from 2008 to 2012; the rate for substantiated child abuse/neglect cases and family assessments increased 13%, and the rate for out-of-home placement entries increased 21%.

## **CHILD PROTECTION AND SAFETY: OUTCOME**

# Child Deaths, Ages 1-14

As with infant mortality, the child death rate is a significant indicator of child well-being. Although mortality rates drop sharply after the first year of life, children are still at risk from a number of health and environmental factors. This outcome reflects physical health conditions, the amount of adult supervision, and the prevalence of risks that children face every day in their homes and communities. For this age group (1-14), accidents are the leading cause of death, with automobile accidents accounting for 31% of deaths nationally.<sup>1</sup>

# **Child Abuse/Neglect & Family Assessments**

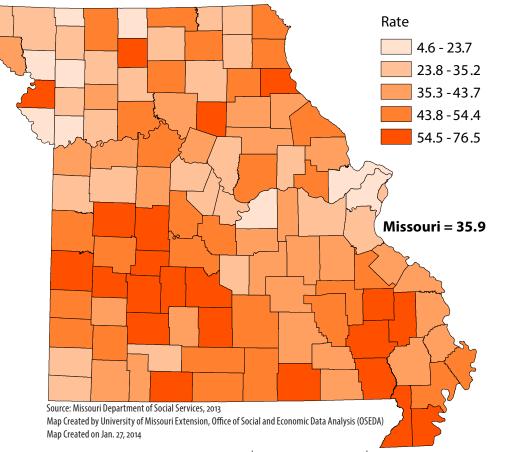

This indicator provides information about the scale of neglectful family environments in a given geographic region. Compared to children who do not experience abuse and neglect, children who do are more likely to experience negative outcomes throughout their lives in a number of areas:

- poor mental health;
- increased cognitive difficulties;
- increased social difficulties;
- more likely to abuse drugs and alcohol;

- increased sexual risk-taking;
- higher rates of juvenile deliquency and adult criminal behaviors;
- higher risk for becoming an abuser.1

Ultimately, due to related costs to the health-care, human services, and educational systems, abuse and neglect impact not only the child and family, but communities and society as well.

## **CHILD PROTECTION AND SAFETY: OUTCOME**

# **Out-of-Home Placement Entries**

This indicator is as a reflection of the number of children whose lives are significantly disrupted due to a harmful situation in their homes, thus providing information on the severity of neglectful family environments for children. Many of the children who are removed from their homes are experiencing profound abuse, neglect, or disruption. These children are considered to be at risk for adverse outcomes.

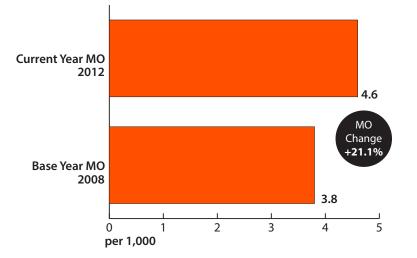

If a child is residing in an unsafe home or experiencing abuse or neglect, he or she may need to be removed from the home and placed in a new, stable environment. Once a child is placed in a new setting, the state must continue to monitor his or her safety, health, and overall well-being. Unfortunately, when children are removed from their homes, they often lose contact with other family members and friends, go through multiple placements, and have overlooked physical health, mental health, and educational needs.

Children who are placed in kinship/relative care (non-parental family members raising children to whom they are related) experience more stability than children in other forms of foster care, have greater positive perceptions of their placements, and have fewer behavioral problems.<sup>1</sup>

# Violent Deaths, Ages 15-19

Overall rates of injury and death increase dramatically from childhood to late adolescence, due to developmental and social factors such as increasing independence and less time spent without adult supervision.<sup>1</sup> Biology also plays a role. The maturation of brain networks responsible for self-regulation does not typically occur until late adolescence or early adulthood, making teens more likely to engage in risk-taking behaviors.<sup>1</sup> In 2012, the leading cause of violent deaths for Missouri teens was motor vehicle accidents. Nationally, cell phone use was reported as the cause of 21% of fatal accidents involving distracted young drivers ages 15-19.<sup>2</sup>

# **EDUCATION: PERSPECTIVE**

Early childhood, elementary, and secondary education provide the foundation for children's future success in our society. Preparing children for school, maximizing their development and achievement in all arenas, and ensuring that they stay in school are key goals to helping all Missouri children have the chance to be productive adults. For Missouri to be a significant economic competitor in the future, the state will need a highly educated and skilled workforce.

From economists to military generals, the importance of early childhood education has been touted as one of the most logical and cost-effective ways to address problems in the education pipeline. High quality early learning experiences provide the building blocks for children's school readiness. Approximately two-thirds of Missouri's children under 6 spend a portion of their day in the care of someone other than their parents Research has demonstrated the positive impact of good preschool programs on children's future academic success. Compared to peers who did not participate in early education programs, children who attend high quality preschools are:

- more likely to have better grades
- less likely to need special education classes
- more likely to graduate high school and enroll in college
- · less likely to engage in criminal behavior throughout life
- more likely to be employed
- less likely to depend on public assistance
- less likely to become teenage parents.<sup>1</sup>

Adolescence is another crucial developmental period in a child's life. There are several key developmental milestones that must be met to ensure a successful transition to productive adulthood, ranging from the most basic—surviving the teen years and avoiding criminal activity—to milestones required for higher level functioning in the adult world, such as succeeding in school and delaying starting a family and childrearing responsibilities. Recent advances in understanding how adolescent brains develop demonstrate that teens do not have many of the neural structures in place for required for appropriate and consistent self-regulation2, which often leads them to make decisions not in their best interests.

KIDS COUNT tracks two outcomes related to educational success:

- Annual high school dropouts
- Births to teens, ages 15-19

In addition, four other education-related indicators are reported:

- Juvenile law violation referrals, ages 10-17 (per 1,000)
- English language learners
- · Licensed child care capacity
- Accredited child care facilities

In comparison to the base years, the educational outlook for Missouri children is positive. One of the most important outcomes, annual high school dropouts, decreased from 2008 to 2012, from 3.5% to 3.0%. Another positive trend is the 26% decrease in birth to teens ages 5-19 between 2008 and 2012. Juvenile law referrals also decreased 17% from 2008 to 2012. With respect to indicators related to early childhood education, the findings are mostly positive. The licensed child care capacity rate per 1,000 children increased 2% from 2008 to 2013, and the number of accredited child care facilities increased by 3% during the same time period. Finally, as would be expected in our state as it becomes more demographically and culturally diverse, the number of children who are English language learners increased by a robust 28% from 2008 to 2012.

## **EDUCATION: OUTCOME**

# **Annual High School Dropouts**

When students drop out of high school, they face many challenges that hinder their abilities to become successful and productive adults. In 2012, the mean annual income for a high school dropout in the U.S. was \$21,622, whereas the mean income for a high school graduate was \$32,630.<sup>1</sup> Youth who leave high school without receiving a diploma are more likely to be unemployed, receive public assistance, and be incarcerated as adults.<sup>2</sup> In addition, high school dropouts are more likely to be single parents and to have children who also do not complete high school.<sup>2</sup>

Research shows that over their working lives, the average high school dropout will have a negative net fiscal contribution to society of nearly -\$5,200, while the average high school graduate generates a positive lifetime contribution of \$287,000. Relative to an average person who graduates high school, the average high school dropout will cost taxpayers over \$292,000 in lower tax revenues, higher cash and in-kind transfer costs, and more incarceration costs.<sup>3</sup> Addressing the dropout problem can help support long-term economic growth within a state.

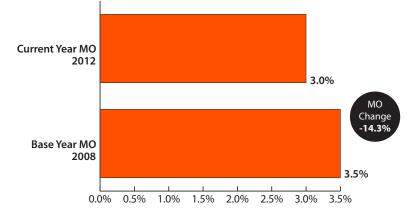

## Rate 0.0% - 0.7% 0.8% - 1.9% 2.0% - 3.3% 3.4% - 5.6% 5.7% - 14.6% Missouri = 3.0% Source: Missouri Department of Elementary and Secondary Education, 2013 Map Created by University of Missouri Extension, Office of Social and Economic Data Analysis (OSEDA) Map Created on Jan. 27, 2014

## **EDUCATION: OUTCOME**

# Births to Teens, Ages 15-19

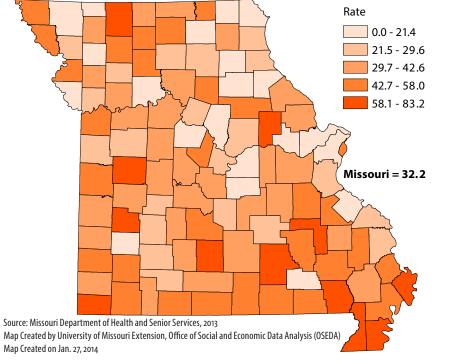

Giving birth as a teen presents social, economic, and health risks for both the mother and baby. Teen mothers are more likely than other young women to drop out of school, remain unmarried and become single parents, and live in poverty and rely on public assistance.<sup>1</sup> The children of teen mothers also face adverse consequences since teen mothers are less likely to have the necessary financial resources, social supports, and parenting skills to ensure healthy child development. Research has shown that, compared to children born to older mothers, children born to teen mothers are more likely to:

- · be classified as low birthweight;
- be premature;
- suffer abuse and neglect;
- have lower cognitive skills;
- · show deficits in social and emotional skills;

- experience more problems in physical well-being and motor development;
- drop out of high school;
- · become teen parents as well;
- spend time in prison.<sup>1, 2, 3</sup>

Teen childbearing also affects society in general. In Missouri, the taxpayer costs associated with children born to teen mothers was over \$200 million annually, including costs for public health care, child welfare, increased rates of incarceration, and lost tax revenue due to decreased wages and spending.<sup>4</sup> Scotland Welfare, increased rates of incarceration, and lost tax revenue due to decreased wages and spending.<sup>4</sup>

## **EDUCATION: INDICATOR**

Map Created on Jan. 27, 2014

# **English Language Learners**

When children have difficulty speaking, reading, or otherwise communicating in English because of their home language, it can affect their abilities to succeed academically. However, because the source of these data are individual school districts, and because there are no absolute guidelines for identifying such students, the number of students who are English language learners may be difficult to compare across time and across counties.

## **EDUCATION: INDICATOR**

# **Licensed Child Care Capacity**

For child care programs, meeting licensure requirements is a first step toward providing quality care. However, licensure only addresses the basic needs and requirements for facilities that provide child care and is not a guarantee of high quality services. Licensed child care capacity, relative to the number of children needing child care in a community, is an important factor in determining whether families can find and afford care for their children.

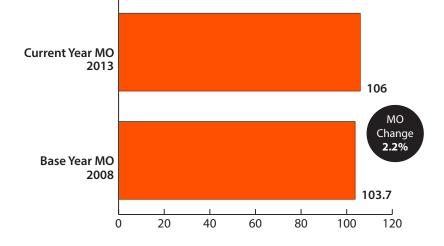

## Licensed Child Care Capacity per 1,000 by County: 2013

# **Accredited Child Care Facilities**

Accreditation is a voluntary process that child care facilities, including afterschool care programs, go through to demonstrate that the program they offer meets the accrediting entity's standards for quality. Accreditation standards go beyond licensing requirements and address every aspect of a facility's operations. It should be noted that standards differ among accrediting agencies.

## **EDUCATION: INDICATOR**

# Juvenile Law Violation Referrals, Ages 10–17

Antisocial behavior may be a normal part of growing up—or the beginning of a long-term pattern of adult criminal activity. Many young people commit some kind of petty offense at some point during their adolescence and yet do not become adult criminals. However, studies have shown that about half the adolescents who had juvenile justice records went on to become adults with felony records.<sup>1,2,3</sup>

Because the brain networks responsible for self-regulation are continuing to develop in adolescence, teenagers are less likely to think about future consequences of their present actions, more likely to take great risks, to make impulsive decisions, and to be vulnerable to coercion by peers.<sup>4</sup> In addition, other familial and societal factors also play direct and indirect roles, including poverty, family instability, family conflict and violence, poor parental supervision, and gang membership.<sup>5</sup>

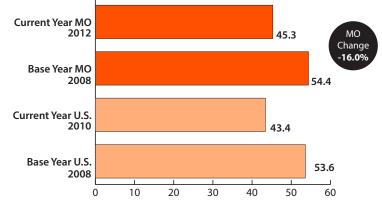

In Missouri, minority youth comprised 34% of the referrals in 2012, whereas non-minority youth accounted for 66%. Minority youths continue to have a disproportionate involvement with the juvenile justice system.

# **DEMOGRAPHIC: PERSPECTIVE**

Both nationally and in Missouri, children under 18 make up almost a quarter of the population. For both the state and nation, the number of children is shrinking slightly. In addition, the percentage of the population that children under 18 represent has been shrinking steadily over time, mostly due to decreased immigration, declining fertility, and the overall aging of the general population.<sup>1</sup> The percentage of minority children, on the other hand, has been increasing over time; the U.S. saw a 3.9% increase in minority children from 2008 to 2012, whereas Missouri saw a 3.4% increase over the same years.

KIDS COUNT reports on three demographic indicators:

- Child population
- Children as percent of total population
- Minority children

## **DEMOGRAPHIC: INDICATOR**

# **Children as Percent of Total Population**

Just as the overall number of children is decreasing in the U.S. and Missouri, the percentage of the total population that is under 18 is also shrinking. This decrease is due to a number of factors, including declining fertility rates, decreased immigration, and the overall aging of the population.<sup>1</sup>

## **DEMOGRAPHIC: INDICATOR**

# **Minority Children**

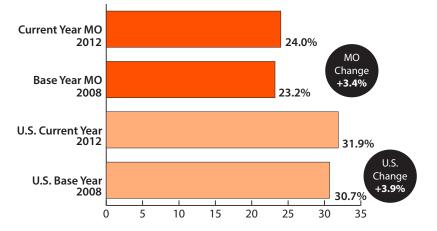

In Missouri, from 2008 to 2012, the population of minority groups grew faster than non-Hispanic Whites, whose overall numbers declined slightly. The fastest growing group was multracial (two races or more), followed by Asians, and African Americans.<sup>1</sup>

Percentage of children under age 18 who are identified as non-white. Source: U.S. Department of Commerce, Bureau of the Census; Missouri Office of Administration, Division of Budget and Planning.

<sup>1</sup>Based on American Community Survey data, 2008 and 2012

## **Data Notes and Sources**

### **OUTCOME MEASURES**

### **ECONOMIC WELL-BEING**

**Students enrolled in free/reduced lunch:** Number of students who are enrolled in the free or reduced-price National School Lunch Program. Children from households with incomes less than 130% of poverty are eligible for free lunches; those from households below 185% of poverty are eligible for reduced price lunches. Rate is expressed as percent of total school enrollment. *Source: Missouri Department of Elementary and Secondary Education; Missouri Office of Administration, Division of Budget and Planning.* 

**Births to mothers without high school diplomas:** Number of live births that occur to women who have less than 12 years of education as indicated on a child's birth certificate. Rate is expressed as percent of all live births. *Source: Missouri Department of Health and Senior Services.* 

### HEALTH

**Low birthweight infants:** Number of live infants recorded as having a birth weight under 2,500 grams (five pounds, eight ounces). Rate is expressed as a percent of total live births. Data were aggregated over five-year periods in order to provide more stable rates. *Source: Missouri Department of Health and Senior Services*.

**Infant mortality:** Number of deaths to infants under one year of age. Rate is expressed per 1,000 live births. Data were aggregated over five-year periods in order to provide more stable rates. *Source: Missouri Department of Health and Senior Services*.

### **CHILD PROTECTION & SAFETY**

**Child deaths, ages 1-14:** Number of deaths from all causes of children ages 1 to 14. Rate is expressed per 100,000 children of that age group. Data were aggregated over five-year periods in order to provide more stable rates. *Source: Missouri Department of Health and Senior Services; U.S. Department of Commerce, Bureau of the Census; Missouri Office of Administration, Division of Budget and Planning.* 

**Child abuse/neglect and family assessments:** Number of child abuse victims from reports classified as "preponderance of evidence" that indicates child abuse or neglect has occurred. In addition, this outcome includes the number of family assessments that have occurred based on potential for abuse/neglect. Rate is expressed per 1,000 children. *Source: Missouri Department of Social Services; U.S. Department of Commerce, Bureau of the Census; Missouri Office of Administration, Division of Budget and Planning.* 

**Out-of-home placement entries:** Number of entries into Division of Family Services alternative care, including foster care, group homes, relative care, and residential settings. Rate is expressed per 1,000 children. *Source: Missouri Department of Social Services; U.S. Department of Commerce, Bureau of the Census; Missouri Office of Administration, Division of Budget and Planning.* 

### **EDUCATION**

**Annual high school dropouts:** Number of students (grades 9 through 12) enrolled in public schools that left school during the school year without graduating. Rate is expressed as percent of enrolled students. The formula used to calculate the rate accounts for transfers in and out of a district. Years indicated are school years; for example, 2012 indicates the 2011-2012 school year. *Source: Missouri Department of Elementary and Secondary Education*.

**Births to teens, ages 15-19:** Number of live births that occur to girls ages 15 to 19. Rate is expressed per 1,000 girls of that age group. *Source: Missouri Department of Health and Senior Services; Missouri Office of Administration, Division of Budget and Planning.* 

**Violent deaths, ages 15-19:** Number of deaths from homicides, suicides, motor vehicle crashes, and other accidents to teens ages 15 to 19. Rate is expressed per 100,000 teens of that age group. Data were aggregated over five-year periods in order to provide more stable rates. *Source: Missouri Department of Health and Senior Services; U.S. Department of Commerce, Bureau of the Census; Missouri Office of Administration, Division of Budget and Planning.* 

### INDICATORS ECONOMIC WELL-BEING

**Children in poverty:** Percentage of related children under age 18 who live in families with incomes below the U.S. poverty threshold, as defined by the Bureau of the Census. The federal poverty threshold depends on the number of adults and children in a family. In 2011, the current year used for this indicator in this data book, the federal poverty threshold for a family of two adults and two children was \$22,811. For 2013, the federal poverty threshold for the same family was \$23,624. For counties with a population of less than 20,000, an estimate based on county-PUMA (Public Use Microdata Area) ratio is reported. *Source: U.S. Department of Commerce, Bureau of the Census.* 

**Children under 6 in poverty:** Percentage of related children under age six who live in families with incomes below the U.S. poverty threshold, as defined by the Bureau of the Census. The 2011 poverty threshold was \$22,811 for a family of four. For counties with a population of less than 20,000, an estimate based on county-PUMA ratio is reported. *Source: U.S. Department of Commerce, Bureau of the Census.* 

**Children in single-parent families:** Percentage of related children under age 18 who live in families headed by a person without a spouse present in the home. *Source: U.S. Department of Commerce, Bureau of the Census.* 

**Children receiving child care assistance:** Total number of children participating in one of the following subsidized child care programs: FUTURES, transitional, income maintenance/income eligible, at-risk, and child care and development block grant. Rate is expressed per 1,000 children under 18 in poverty. *Source: Missouri Department of Social Services; U.S. Department of Commerce, Bureau of the Census.* 

**Children receiving cash assistance:** Average monthly percentage of population under age 18 that live in households receiving public assistance under Temporary Assistance for Needy Families (TANF). *Source: Missouri Department of Social Services; U.S. Department of Commerce, Bureau of the Census; Missouri Office of Administration, Division of Budget and Planning.* 

**Children receiving SNAP (food stamps):** Percentage of population under age 18 who live in households receiving benefits under the Supplemental Nutrition Assistance Program (SNAP), formerly known as food stamps.

Source: Missouri Department of Social Services; U.S. Department of Commerce, Bureau of the Census; Missouri Office of Administration, Division of Budget and Planning.

**Average annual wage/salary:** Average annual wage/salary per job. County data indicate annual wage/salary for all jobs located in that county. An employee may live in a different county from where they work. *Source: U.S. Department of Commerce, Bureau of Economic Analysis.* 

**Adult unemployment:** Percentage of civilian labor force that is unemployed and actively looking for work. *Source: Missouri Department of Economic Development, Division of Employment Security.* 

### HEALTH

**Children enrolled in MO HealthNet for Kids:** Average monthly percentage of children under age 18 who have applied for and have been certified eligible for participation in MO HealthNet for Kids, Missouri's health insurance program for children in low-income families, either through managed care or traditional fee-for-service providers. This indicator includes both number and rate. *Source: Missouri Department of Social Services; U.S. Department of Commerce, Bureau of the Census; Missouri Office of Administration, Division of Budget and Planning.* 

**Children receiving public mental health services:** An unduplicated count of children receiving treatment through a division of the Missouri Department of Mental Health (DMH) for serious emotional disorders (SED) as of January 1st of the year reported for whom DMH provided a service in that calendar year. *Source: Missouri Department of Mental Health*.

#### **EDUCATION**

**Children with limited English proficiency:** Number of children reported by school districts as having limited English language skills. *Source: Missouri Department of Elementary and Secondary Education*.

**Licensed child care capacity:** Number of spaces in licensed family child care homes, group child care homes, and child care centers. Rate is expressed per 1,000 children under 18. *Source: Missouri Department of Health and Senior Services; U.S. Department of Commerce, Bureau of the Census.* 

**Accredited child care facilities:** Number of child care centers accredited by National Association for the Education of Young Children (NAEYC), Missouri Accreditation (MO-A), National Association for Family Child Care (NAFCC), National Afterschool Association (NAA), National Early Childhood Program Accreditation (NECPA), Council on Accreditation (COA), or the Commission on Accreditation of Rehabilitation Facilities (CARF). *Source: Child Care Aware of Missouri*.

**Juvenile law violation referrals, ages 10-17:** Number of referrals to juvenile courts in Missouri for acts that would be violations of the Missouri Criminal Code if committed by an adult. The count represents separately disposed court referrals, not individual youth. Rate is expressed per 1,000 youths ages ten through 17. *Source: Missouri Department of Social Services; Missouri Office of Administration; U.S. Department of Commerce, Bureau of the Census.*
